

# U.S. WALL GUIDE

**Featuring Trus Joist® TimberStrand® LSL  
and Parallam® PSL Wall Framing**

- Engineered to meet code requirements for walls up to 30' tall
- Easy-to-use tables adaptable to a variety of wind conditions, surface finishes, and wall layouts
- Out-of-plane wind and vertical load information for designing walls that are stiff, strong, and straight
- Limited product warranty

The products in this guide are readily available through our nationwide network of distributors and dealers. For more information on other applications or other Trus Joist® products, contact your Weyerhaeuser representative.

**Code Evaluations:**  
See ICC-ES ESR-1387

## Choose Trus Joist® wall framing for straight, flush walls that:

- are critical for tile applications.
- allow easy countertop and cabinet installation in kitchens and bathrooms.
- give visual appeal to tall walls in great rooms and entryways.
- have the strength and stiffness to accommodate “window” walls.

Many of today’s homes have design requirements—such as walls over 10 feet tall—that exceed the code provisions for conventional construction. Trus Joist® TimberStrand® laminated strand lumber (LSL) and Parallam® parallel strand lumber (PSL) can help you meet the requirements of these challenging designs. Weyerhaeuser also offers product and design support that includes technical information, design software, and design advice from our team of skilled engineers and sales representatives.

### Tall wall software solutions

ForteWEB® software is a single-member sizing solution created by Weyerhaeuser to help estimators, architects, and engineers design walls quickly and efficiently. ForteWEB® software provides the most economical solutions for studs, columns, and headers, and helps you design connections for each member. Professional calculations can be printed out for engineer sign-off or to give to building officials. Ask your Weyerhaeuser representative how you can get ForteWEB® software today.

## This guide features the following Trus Joist® wall framing products:

### 1.3E TimberStrand® LSL

**Studs:** 1½" x 3½" (2x4) • 1½" x 5½" (2x6)

**Columns:** 3½" x 5½" • 3½" x 7¼"

**Headers:** 3½" x 5½" • 3½" x 7¼"

### 1.5E TimberStrand® LSL

**Studs and Columns:** 1½" x 7¼" (2x8)

### 1.55E TimberStrand® LSL

**Studs and Columns:** 1¾" x 5½" • 1¾" x 7¼"

**Headers:** 3½" x 9½" • 3½" x 11⅞"

### 1.8E Parallam® PSL

**Columns:** 3½" x 3½" • 3½" x 5¼"  
3½" x 7" • 5¼" x 5¼"  
5¼" x 7" • 7" x 7"

**Headers:** 5¼" x 5¼"

### 2.0E Parallam® PSL

**Columns:** 3½" x 9¼" • 5¼" x 9¼"  
7" x 9¼"

**Headers:** 5¼" x 9¼"

*Other sizes may be available in Weyerhaeuser software; however, not all products are available in all markets. Contact your Weyerhaeuser representative for the sizes available in your area.*

## DEFLECTION REQUIREMENTS

### How stiff does a wall need to be?

While model building codes provide required deflection limits based on the type of finish supported by the wall framing, acceptable deflection limits are usually established by the design professional, finish-material provider, and/or building code authority. Typical deflection requirements are shown in table below.

### Code Minimum Deflection Criteria

Type of Wall	Maximum Deflection
Exterior walls with plaster or stucco finish <sup>(1)</sup>	L/360 <sup>(5)</sup>
Exterior walls with brittle finishes <sup>(1)(2)</sup>	L/240
Exterior walls with flexible finishes <sup>(4)(2)</sup>	L/120
Exterior walls with interior gypsum board finish <sup>(3)</sup>	L/180
Members supporting windows (mullions) <sup>(4)</sup>	L/175

(1) 2012/2015/2018/2021 International Residential Code (IRC) Table R301.7

(2) 2012/2015/2018/2021 International Building Code (IBC) Table 1604.3

(3) 2012/2015/2018/2021 IRC Table R301.7, footnote d

(4) 2012 IRC, Section R612.8.2; 2015/2018/2021 IRC Section R609.8.2; 2012/2015/2018/2021 IBC Section 2403.3

(5) For finishes that require a deflection stricter than L/360, contact your Weyerhaeuser representative.

# CONVENTIONAL CONSTRUCTION APPLICATIONS

## Limitations of Conventional Construction

*For walls up to 10' in height, 2x4 and 2x6 1.3E TimberStrand® LSL studs may be conventionally specified per the limitations described on this page. Engineered design for more demanding applications is outlined on the pages that follow.*

### Wind Limitations

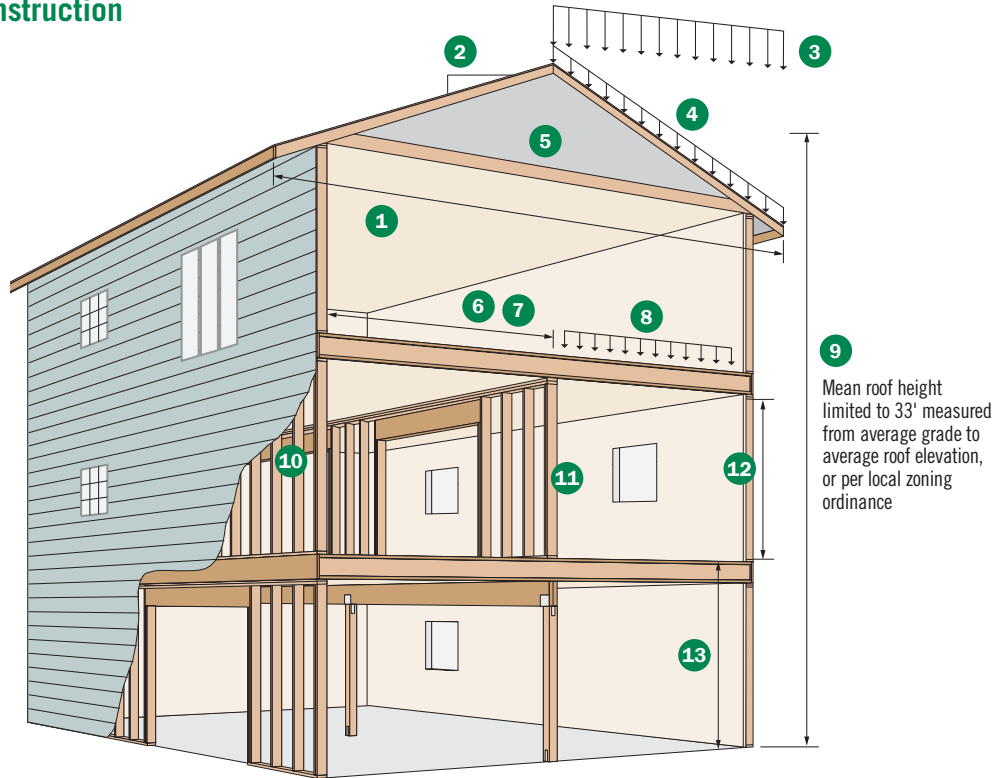

Basic wind speed (2012/2015 IRC):  
Figure R301.2(4)B

Basic wind speed (2018 IRC):  
Figure R301.2(5)B

Basic wind speed (2021 IRC):  
Figure R301.2.1.1

### Seismic Design Categories

A, B, C, D<sub>0</sub>, D<sub>1</sub>, and D<sub>2</sub>. Excludes irregular portions of structures as defined by 2012/2015 IRC Section R301.2.2.2.5 and 2018/2021 IRC Section R301.2.2.6

## Limitation Descriptions and IRC References

Description	IRC Reference
1 Maximum roof span, including overhangs, limited to 40'. Maximum tabulated rafter span (horizontal projection) and ceiling joist span of 26'.	IRC Section R802.10.2.1; footnote a to 2012/2015 IRC Tables R802.4(1), R802.4(2) and 2018/2021 IRC Tables R802.5.1(1), R802.5.1(2); footnote b to 2012/2015 IRC Tables R802.5.1(1)–R802.5.1(8) and 2018/2021 IRC Tables R802.4.1(1)–R802.4.1(8)
2 Roof pitch: 3:12 minimum, 12:12 maximum	
3 Maximum ground snow load: 70 psf	IRC Section R301.2.3
4 Maximum tabulated roof/ceiling dead load: 20 psf	2012/2015 IRC Tables R802.5.1(1)–R802.5.1(8) and 2018/2021 Tables R802.4.1(1)–R802.4.1(8)
5 Maximum tabulated rafter and ceiling joist spacing: 24" on-center	2012/2015 IRC Tables R802.4(1), R802.4(2), R802.5.1(1)–R802.5.1(8) and 2018/2021 IRC Tables R802.4.1(1)–R802.4.1(8), R802.5.1(1), R802.5.1(2)
6 Maximum tabulated joist span: 26'	IRC Tables R502.3.1(1), R502.3.1(2)
7 Maximum tabulated floor joist spacing: 24" on-center	IRC Tables R502.3.1(1), R502.3.1(2)
8 Maximum uniform floor loads: 40 psf live load, 20 psf dead load	IRC Tables R502.3.1(1), R502.3.1(2)
9 Maximum of 3 stories	IRC Section R101.2
10 Maximum stud spacing: 24" on-center	IRC Table R602.3(5)
11 With TJI® joist floor systems, load-bearing walls must stack directly over bearing walls or beams below. With rectangular joists, walls may be offset a distance equal to the joist depth.	IRC Section R502.4
12 Maximum load-bearing stud length: 10' between points of lateral support	IRC Table R602.3(5)
13 Maximum story height: 10' stud height plus 16" floor framing = 11'-4"	IRC Section R301.3

## Stud Specifications for Conventional Applications per IRC Table R602.3(5)<sup>(1)</sup>

Stud Size	Bearing Walls					Nonbearing Walls	
	Laterally unsupported stud height <sup>(1)</sup>	Maximum spacing when supporting roof and ceiling only	Maximum spacing when supporting one floor, roof, and ceiling	Maximum spacing when supporting two floors, roof, and ceiling	Maximum spacing when supporting one floor only	Laterally unsupported stud height <sup>(2)</sup>	Maximum spacing
2x4	10'	24"	16"	—	24"	14'	24"
2x6	10'	24"	24"	16"	24"	20'	24"

(1) See IRC for additional requirements and limitations.

(2) Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall.

*When used in conventional construction applications, both 2x4 and 2x6 TimberStrand® LSL studs may be drilled or notched in accordance with IRC Section R602.6.*

# DEFINITIONS

**Buckling Length**—Distance along the length of a member between braced points. This length is used to calculate the buckling stability of the member.

**Conventional Construction**—Generally, home design based on traditional construction methods and materials that have a history of adequate structural performance for specific building types and sizes. Both conventionally specified and pre-calculated members and connections are prescriptively specified in building codes such as the IRC and IBC, and may be combined to form a structure or structural assemblage.

**Design Wind Pressure**—The equivalent static wind pressure applied to structures to determine wind loads for buildings.

**Effective Wind Area**—The area used to determine external wind coefficients. These coefficients are used in the determination of the design wind pressures for components and cladding elements. Generally, the effective wind area is the length of a member's span multiplied by the tributary width or  $L^2/3$ , whichever is greater.

**Lateral Loads**—Loads applied to a structure in the horizontal direction. This includes loads from wind and seismic events.

**Main Force Resisting System**—Structural elements designated to provide support and stability for the overall structure. The system generally receives wind loading from more than one surface.

**Tributary Area**—A calculated area of influence surrounding a structural member. Loads within this area are added together to determine the amount of load a member is required to resist. For example, the tributary area for a wall stud is the sum of  $\frac{1}{2}$  the distance to the adjacent wall stud on each side of the stud in question. Likewise, the tributary area for a floor joist would be the sum of  $\frac{1}{2}$  the distance to the adjacent joist on each side of the joist in question.

# ENGINEERED DESIGN ASSUMPTIONS

**Design applications are limited to vertical loads, and to lateral wind loads that are perpendicular to the wall framing.** Table information is based on the strength calculations and deflection limits of wall framing members, and was generated with the following assumptions:

- Member design and lateral support requirements for bending are based on National Design Specification® (NDS®).
- Stud and column tables assume structural sheathing on one side of the wall, or a combination of gypsum wallboard and non-structural sheathing or siding applied to each side of the wall, or equivalent.
- Blocking required at 8' on-center maximum per code. See page 12.
- Column bracing assumed to be 8' on-center maximum. Stud bracing at 1' on-center maximum.
- Beams and columns must remain straight to within  $\frac{5L}{4608}$  (in.) of true alignment. L is the unrestrained length of the member in feet.

- If stud spacing is 19.2" or 24" on-center, trusses or rafters must be installed within 3" of the stud locations. This does not apply if studs are spaced at 16" on-center or less.
- The Components & Cladding (C&C) pressures shown in the **Wall Design Wind Pressure** table below are used only for strength calculations.
- Deflection limits are based on Main Wind Force Resisting System pressures, which were estimated by multiplying the C&C pressure by 0.70 (IRC Table R301.7 and IBC Table 1604.3).

$$\Delta = \frac{270 wL^4}{Ebd^3} + \frac{28.8 wL^2}{Ebd}$$

$\Delta$  = deflection  
w = uniform load (plf)  
L = span (ft)  
b = member width (in.)  
d = member depth (in.)  
E = modulus of elasticity (psi)

# WIND TABLES

## Wall Design Wind Pressure (PSF)<sup>(1)(2)</sup>

Exposure Category <sup>(3)</sup>	Effective Wind Area <sup>(4)</sup> (ft <sup>2</sup> )	Basic Wind Speed (mph)												
		2012/2015/2018/2021 IRC/IBC (ASCE 7-10/7-16/7-22: 0.6W)												
		90	95	100	105	110	115	120	130	140	150	160	170	180
B	≤ 10	9.7	10.9	12.0	13.3	14.6	15.9	17.3	20.3	23.6	27.1	30.8	34.8	39.0
	50	8.8	9.8	10.9	12.0	13.2	14.4	15.7	18.4	21.3	24.5	27.8	31.4	35.2
	≥ 100	8.4	9.4	10.4	11.4	12.5	13.7	14.9	17.5	20.3	23.3	26.6	30.0	33.6
C	≤ 10	13.6	15.1	16.7	18.5	20.3	22.1	24.1	28.3	32.8	37.7	42.9	48.4	54.3
	50	12.3	13.7	15.1	16.7	18.3	20.0	21.8	25.6	29.7	34.0	38.7	43.7	49.0
	≥ 100	11.7	13.0	14.4	15.9	17.5	19.1	20.8	24.4	28.3	32.5	37.0	41.7	46.8
D	≤ 10	16.1	17.9	19.8	21.9	24.0	26.2	28.6	33.5	38.9	44.6	50.8	57.3	64.3
	50	14.5	16.2	17.9	19.8	21.7	23.7	25.8	30.3	35.1	40.3	45.9	51.8	58.1
	≥ 100	13.9	15.4	17.1	18.9	20.7	22.6	24.6	28.9	33.5	38.5	43.8	49.4	55.4

- (1) Tabulated pressures are based on the Analytical Procedure defined in ASCE 7. Values assume a Components and Cladding (C&C) member in the interior zone of an enclosed structure, with the following factors:
- Risk/occupancy category II
  - Topographical factor of 1.0
  - Elevation factor of 1.0
  - Mean roof height of 33'

(2) When designing in accordance with 2012/2015/2018/2021 IRC/IBC, the load combinations include a 0.6 factor for wind.

(3) Exposure categories are generally defined as follows (see ASCE 7):

- B = Urban and suburban areas, wooded areas
- C = Open terrain with scattered obstructions generally less than 30' in height
- D = Flat, unobstructed areas

(4) **Effective Wind Area** is the span multiplied by the tributary width or  $L^2/3$ , whichever is greater. For values of effective wind areas not listed, interpolation between 10 ft<sup>2</sup> and 100 ft<sup>2</sup> is allowed.

- Check local codes for any special wind pressures.

## Effective Wind Area

Wall Height	Stud/Column Effective Wind Area (ft <sup>2</sup> )
≥ 18'	100
16'	85
14'	65
12'	48
10'	33

- Values are based on  $L^2/3$  with a maximum of 100 ft<sup>2</sup>.
- The effective wind area should not be confused with the tributary area, which is used to determine the amount of load applied to an individual member.

# DESIGN EXAMPLE

## Given

- Wall height = 20'
- Rough opening = 6'
- Exposure Category B
- 140 mph basic wind speed
- 2021 IRC/IBC
- Flexible exterior finish with interior gypsum board finish; walls support window mullions
- Maximum column vertical load = 5,000 lbs
- Maximum header vertical load = 250 plf

When designing with C&C pressures, the effective wind area ( $L^2/3$ ) helps determine the wall design wind pressure. A smaller effective wind area results in a higher wind pressure. The effective wind area should not be confused with the tributary area, which is used to determine the amount of load applied to an individual member.

### 1. Determine effective wind areas (ft<sup>2</sup>):

- For the studs and columns, refer to the **Effective Wind Area** table above. A 20' stud or column will have an effective wind area of 100 ft<sup>2</sup>.
- For each header, consult the drawing at right and use the maximum value of the rough opening (L) multiplied by the tributary width or  $L^2/3$ , whichever is greater.
  - For the top header in our example wall, use the maximum of either (6' x 5' = 30 ft<sup>2</sup>) or ( $6^2/3 = 12$  ft<sup>2</sup>).
  - For the bottom header in our example wall, use the maximum of either (6' x 10' = 60 ft<sup>2</sup>) or ( $6^2/3 = 12$  ft<sup>2</sup>).

The effective wind areas calculate to 30 ft<sup>2</sup> for the top header and 60 ft<sup>2</sup> for the bottom header, so interpolation would be required to find exact pressures. For simplicity, we will use an effective wind area of 10 ft<sup>2</sup> for each header. This allows us to skip the interpolation exercise, and provides a more conservative wind pressure.

### 2. Determine design wind pressure:

Consult the **Wall Design Wind Pressure** table on page 4, using the example wall's criteria of Exposure B, a 140 mph basic wind speed, and an effective wind area as calculated above:

- For studs/columns with an effective area of 100 ft<sup>2</sup>, the wall design lateral wind pressure is 20.3 psf.
- For headers with an effective area of 10 ft<sup>2</sup>, the wall design wind pressure is 23.6 psf.

### 3. Determine appropriate deflection criteria:

Consult the **Code Minimum Deflection Criteria** on page 2. Our example wall contains both windows (minimum L/175) and a flexible finish with interior gypsum board (minimum L/180). Because the L/180 deflection is more restrictive, the wall should be designed using the L/180 deflection values in this guide.

Refer to stud, column, and header tables on pages 6–10 to design the components for this example wall.

*A complete wall specification should include permanent bracing, safety bracing, blocking, connections, details, etc. See pages 11–14.*

## ONE-HOUR WALL ASSEMBLY WITH TIMBERSTRAND® LSL STUDS

**2x6 Wall Application:** 2x6 wall made with TimberStrand® LSL studs and gypsum wallboard applied horizontally. 2x6 or larger TimberStrand® LSL is permitted as a substitute in fire-rated assemblies when used in the same or larger dimensions as sawn lumber.

### TimberStrand LSL Wall Assembly

1. 2x6 TimberStrand® LSL studs, spaced 16" on-center, with double top plates and single bottom plate
  2. 5/8" Type X gypsum wallboard, 4' wide, applied horizontally. Horizontal joints are unblocked. Horizontal application of wallboard represents the direction of least fire resistance as opposed to vertical application.
  3. 2 1/4" #6 Type S drywall screws, spaced along stud at 7" on-center and covered with joint compound
  4. Wallboard joints covered with paper tape and joint compound
- The design axial compressive stress within the TimberStrand® LSL studs must not exceed the least of the following:
    - 435 psi
    - $F_c \times 0.30$ , where  $F_c$  is the compression design value parallel-to-grain for the TimberStrand® LSL, adjusted by all applicable adjustment factors (in accordance with the NDS®), including the column stability factor  $C_p$
    - $F_c \times 0.30$ , where  $F_c$  is calculated in accordance with the NDS®, assuming a slenderness ratio  $L_d/d$  of 21

*This assembly has been tested to ASTM E119/NFPA 251 and CAN/ULC-S101 Standards.*

# STUD LOAD TABLE AND EXAMPLE

## Studs—Maximum Allowable Lateral (Wind) and Vertical Load

(1) Load based on a wind pressure of 19.1 psf and studs spaced at 16" on-center.

## General Notes

- Table is based on:
  - A load duration factor of 1.60.
  - Stud bracing in **Engineered Design Assumptions** on page 4.
  - A buckling length coefficient of  $K_e = 0.85$ . For deflection, use  $K_e = 1.0$ .
  - Axial loads applied eccentrically, at a distance of ½ of the **wall thickness** dimension of the stud, measured from the stud centerline.
  - A compression perpendicular-to-grain stress of 425 psi, adjusted per NDS®, 3.10.4.
  - A code-allowed repetitive-member increase of 4%.

## Stud Example

For the **Design Example** on page 5, design 20' studs for lateral wind pressure of 20.3 psf and a maximum vertical load of 250 plf:

- Determine the maximum stud length:**  
The maximum stud length in this example wall is 20'.
- Calculate the lateral load in plf:**  
This example uses 16" on-center studs, so calculate the lateral load in plf and the vertical load in lbs as follows:  
 $20.3 \text{ psf} \times 16/12 = 27.1 \text{ plf}$ ;  $250 \text{ plf} \times 16/12 = 333 \text{ lbs}$ .
- Select the appropriate studs:**  
In the **Stud Load Table**, scan across the 20' row until you find a cell in the

*Stud Example continued on page 7*

(1) Load based on a wind pressure of 19.1 psf and studs spaced at 16" on-center.

### Stud Example continued from page 6

30 plf **Lateral Load** column that meets the L/180 deflection and the 333 lbs vertical load criteria. According to the table, a 1.3E TimberStrand® LSL 2x6 stud is not an option. If the stud spacing is changed to 12" on-center (for a plf of 20.3), it still would not meet the L/180 requirement. However, a 1.5E TimberStrand® LSL 2x8 stud (at 3,775 lbs and L/224) spaced at 16" on-center meets the requirements, making it the best option for this wall.

#### ■ Design stud connections:

Convert 27.1 plf into a reaction (uniform load x length/2):  $27.1 (20'/2) = 271$  lbs. Use the **Lateral Connections** tables on page 13 to select a nail or angle clip connection that meets or exceeds 271 lbs. For this example a nailed connection can be calculated as  $271/104 = 2.61$ , so three 16d (0.131" x 3¼") nails (nailed through the plate into the end grain) would work. For an angle clip connection, one Simpson Strong-Tie® A34 angle clip at the top and bottom plate is sufficient.

(1) For 3-ply and 4-ply built-up columns, multiply table values by 1.5 and 2.0, respectively. See page 11 for connection requirements.

■ Green numbers refer to lateral (wind) load (PLF). Black numbers refer to vertical load (lbs).

## General Notes

- Tables are based on:
  - A load duration factor of 1.60.
  - Full-width blocking at a maximum vertical spacing of 8' on-center.
  - A buckling length coefficient of  $K_b = 0.85$ . For deflection use  $K_b = 1.0$ .
  - Axial loads applied eccentrically, at a distance of ⅓ of the wall thickness dimension of the column, measured from the column centerline.
  - A compression perpendicular-to-grain stress of 425 psi.
- Solid sections required where specified. Built-up columns require reductions. Contact your Weyerhaeuser representative for assistance.

## Beam Orientation

## Plank Orientation

Some columns are listed in both beam and plank orientation. The first dimension is for member width, and the second dimension is for member depth (wall thickness).

TimberStrand® LSL and untreated Parallam® PSL are intended for dry-use applications

Not all products are available in all markets. Contact your Weyerhaeuser representative for information.

(1) For 3-ply and 4-ply built-up columns, multiply table values by 1.5 and 2.0, respectively. See page 11 for connection requirements.

- Green numbers refer to lateral (wind) load (PLF). Black numbers refer to vertical load (lbs).

## Column Example

For the **Design Example** wall on page 5, design 20' columns for lateral wind pressure of 20.3 psf and vertical loading of 5,000 lbs:

**Note:** Vertical load is the load applied to the top of the column, excluding the header reaction. The header reaction is assumed to transfer directly to the trimmers.

### Calculate the lateral load in plf:

The calculated wind pressure in the example is 20.3 psf, so 20.3 x 3.67' tributary width = 74.5 plf.

### Select an appropriate column:

Scan the L/180 section of the **Column Load Tables** to find a 20' column that meets or exceeds the 74.5 plf lateral load and the 5,000 lbs vertical load. For this example, a 7" x 5¼" 1.8E Parallam® PSL column (at 79/8,575), used in plank orientation, will work for a 2x6 wall. Alternatively, a double 1¾" x 7¼" 1.55E TimberStrand® LSL column (at 89/6,230) would work for a 2x8 wall.

### Design the column to wall plate connections:

Convert 74.5 plf into a reaction (uniform load x length/2): 74.5 (20'/2) = 745 lbs. Use the **Lateral Connections** tables on page 13 to select a connection that meets or exceeds 745 lbs. For this example 745/545 = 1.37; so according to the **Angle Clips** table, two Simpson Strong-Tie® A34 connectors would be required—one on each side of the column, at both the top and bottom plates.

Girder truss reaction:  
Total load 5,000 lbs

- **Bold italic** values require two trimmers (3" bearing) at ends. Single trimmers may work for lightly loaded **bold italic** sections; see table below.
- **Green numbers** refer to lateral (wind) load (PLF). Black numbers refer to vertical load (PLF).

### General Notes

- Table is based on:
  - A load duration factor of 1.60 for combined lateral and vertical load.
  - A load duration factor of 1.00 for vertical load only.
  - Uniform lateral (wind) and vertical loads (beam weight considered).
  - Vertical deflection, the more restrictive of L/240 or ⅝".
  - A maximum lateral (wind) load of 500 plf.

### Bearing Requirements

- Trimmers must support the full width of the header.
- Minimum header support to be one trimmer (1½") at ends.

### Maximum Allowable Vertical Load (PLF) with One Trimmer

Rough Opening	Wall Thickness	
	3½"	5½"
12'	355	536
10'	428	646
9'	476	718
8'	536	808
7'	613	924
6'	716	1,077
5'	858	1,290
4'	1,069	1,607
3'	1,415	2,126

# HEADER EXAMPLE

## Header Example

The **Design Example** on page 5 assumes that both headers will be the same size, and considers worst-case loading. Design the headers for lateral wind pressure of 23.6 psf based on the lower header's 6' rough opening and 10' tributary width, and a vertical load based on the upper header's maximum 250 plf.

- **Calculate the lateral load in plf:**

The calculated wind pressure in the example is 23.6 psf, so  $23.6 \times 10'$  tributary width = 236 plf.

- **Select the appropriate header:**

Scan the L/180 section of the **Header Load Table** to find a header that meets your requirements (236 plf lateral and 250 plf vertical). For this example, a 6' header of  $5\frac{1}{4}" \times 5\frac{1}{4}"$  1.8E Parallam® PSL (at 500/955) will work for a 2x6 wall. Alternatively, a  $7\frac{1}{4}" \times 3\frac{1}{2}"$  1.3E TimberStrand® LSL header (at 500/290), used in plank orientation, will work for a 2x8 wall. Since the table numbers for these selections are not bold, only one trimmer stud is required for bearing. Headers that do not match the wall thickness must be directly attached to a plate that matches the wall thickness to provide lateral bracing. See detail L13 on page 12.

- **Design header to column connections:**

Convert 236 plf into a reaction (uniform load  $\times$  length/2):  $236 (6'/2) = 708$  lbs. Use the **Lateral Connections** tables on page 13 to select a connection that meets or exceeds 708 lbs. For this example  $708/545 = 1.29$ ; so according to the **Angle Clips** connections table on page 13, two Simpson Strong-Tie® A34 connectors are sufficient—one on top and bottom at each end of both headers.

## MULTIPLE-MEMBER CONNECTIONS

### 2-Ply Nailing Recommendations

- For 2x4,  $1\frac{3}{4}" \times 5\frac{1}{2}"$ , 2x6,  $1\frac{3}{4}" \times 7\frac{1}{4}"$ , and 2x8: Minimum of **two rows** of 16d (0.131"  $\times$  3 $\frac{3}{4}"$ ) nails at 10" on-center, staggered.
- Nail from one side.

### 3-Ply Nailing Recommendations

- For 2x4: Minimum of **two rows** of 16d (0.131"  $\times$  3 $\frac{3}{4}"$ ) nails at 8" on-center, staggered.
- For  $1\frac{3}{4}" \times 5\frac{1}{2}"$ , 2x6,  $1\frac{3}{4}" \times 7\frac{1}{4}"$ , and 2x8: Minimum of **three rows** of 16d (0.131"  $\times$  3 $\frac{3}{4}"$ ) nails at 5" on-center, staggered.
- Nail from both sides.

### 4-Ply Fastening Recommendations

- For 2x4: Nail each ply to the other with a minimum of **two rows** of 16d (0.131"  $\times$  3 $\frac{3}{4}"$ ) pneumatic nails at 5" on-center. When connecting each ply, offset nail rows by 2" from the ply below.
- For  $1\frac{3}{4}" \times 5\frac{1}{2}"$ , 2x6,  $1\frac{3}{4}" \times 7\frac{1}{4}"$ , and 2x8:
  - Nail each ply to the other with a minimum of **three rows** of 16d (0.131"  $\times$  3 $\frac{3}{4}"$ ) pneumatic nails at 5" on-center. When connecting each ply, offset nail rows by 2" from the ply below.
  - or,
  - Minimum of **two rows** of  $\frac{1}{2}"$  diameter bolts spaced at 8" on-center.

## PRODUCT STORAGE

Protect product from sun and water

**CAUTION:**  
Wrap is slippery when wet or icy

Align stickers (2x3 or larger) directly over support blocks

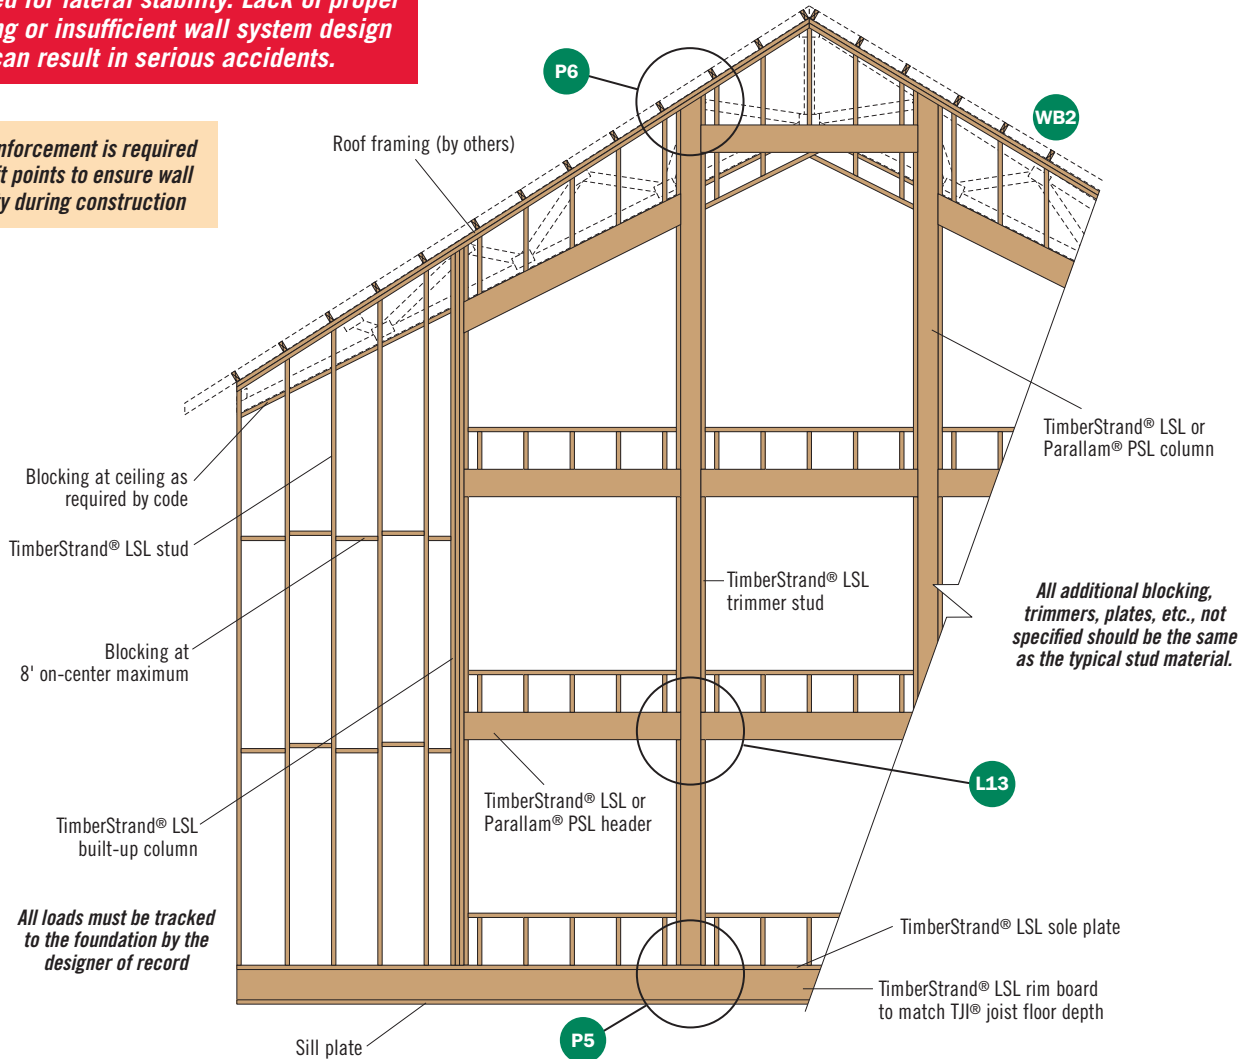

Use support blocks (6x6 or larger) at 10' on-center to keep bundles out of mud and water

# TYPICAL TALL WALL FRAMING

## WARNING

*Safety bracing during construction is required for lateral stability. Lack of proper bracing or insufficient wall system design can result in serious accidents.*

*Wall reinforcement is required at all lift points to ensure wall stability during construction*

## WALL DETAILS

### Header to Column

L13

*Plate width must equal the wall thickness to provide lateral bracing. (Plate not required if header width equals the wall thickness.)*

### Column or Stud to Bottom Plate

P5

### Column or Stud to Top Plate

P6

# WALL DETAILS

## Wind Brace

Details shown are applicable for 115 mph basic wind speeds and the exposure categories and maximum wall heights shown in the table below. For other conditions, contact your Weyerhaeuser representative.

WB2

\* Load 1 value from Lateral Connections—Angle Clips table below.

WB3

\* Load 2 value from Lateral Connections—Angle Clips table below.

## Wind Brace Detail Applicability

Detail	Exposure	Max. Wall Height
WB2	D	25'
	B, C	29'
WB3	B, C	20' <sup>(1)</sup>

(1) Maximum wall height shown includes depth of truss.

## FRAMING CONNECTORS

### Lateral Connections—Nails

Nail Size	End Grain	Toe Nail
8d (0.113" x 2½")	77 lbs	96 lbs
10d (0.128" x 3")	99 lbs	123 lbs
12d (0.128" x 3¾")	99 lbs	123 lbs
16d (0.135" x 3½")	110 lbs	137 lbs
16d (0.131" x 3¾")	104 lbs	129 lbs

### Lateral Connections—Angle Clips

Type	Nails	Length of Connector (L)	Load 1: Allowable Load (lbs)	Load 2: Allowable Load (lbs)
<b>Simpson Strong-Tie®</b>				
A21	Four 10d (0.148" x 1½")	1¾"	150	330
A34	Eight 8d (0.131" x 1½")	2½"	545	430
A35	Twelve 8d (0.131" x 1½")	4½"	650	670
A23	Eight 10d (0.148" x 1½")	2¾"	535	680
<b>USP Structural Connectors®</b>				
AC5	Six 10d (0.148" x 1½")	4⅞"	565	565
A3	Eight 10d (0.148" x 1½")	2¾"	740	605
AC7	Eight 10d (0.148" x 1½")	6⅛"	755	755
AC9	Ten 10d (0.148" x 1½")	8⅞"	945	900

### General Notes

- Tables are based on a load duration factor of 1.60.
- Connection values based on a specific gravity of 0.50.
- For end-grain connections, a 0.67 factor was used (based on NDS®).
- For toenail connections, a 0.83 factor was used (based on NDS®).

In order to use the manufacturer's published capacities when designing column caps, bases, or holdowns for uplift, the bolts or screws must be installed perpendicular to the wide face of strands as shown at left.

DO NOT install bolts or screws into the narrow face of strands

# ALLOWABLE HOLES

## 1.55E TimberStrand® LSL Headers and Beams

### General Notes

- Allowed hole zone suitable for headers and beams with **uniform and/or concentrated loads** anywhere along the member.
- Round holes only.
- No holes in headers or beams in plank orientation.

## 1.55E TimberStrand® LSL

Header or Beam Depth	Maximum Round Hole Size
9½"	3"
11¾"	3⅝"
14"–16"	4⅝"

- See illustration for allowed hole zone.

## Other Trus Joist® Headers and Beams

### General Notes

- Allowed hole zone suitable for headers and beams with **uniform loads only**.
- Round holes only.
- No holes in cantilevers.
- No holes in headers or beams in plank orientation.

## Other Trus Joist® Beams

Header or Beam Depth	Maximum Round Hole Size
5½"	1¾"
7¼"–20"	2"

- See illustration for allowed hole zone.

**DO NOT cut, notch, or drill holes in headers or beams except as indicated in the illustrations and tables above**

## Allowable Holes and Notches\* for TimberStrand® LSL Studs

Per ICC ES ESR-1387, holes may be drilled anywhere along the length of the stud but must be at least ⅝" from the edge

**One notch may be cut anywhere except the middle ⅓ of the length of the stud**

**DO NOT cut a notch and a hole in the same cross section**

\* Applies to stud applications other than 2x4 and 2x6 studs in conventional construction as shown on page 3.

# DESIGN PROPERTIES

## Allowable Design Stresses (100% Load Duration)

Grade MOE (x10 <sup>6</sup> ) (psi)	E <sub>min</sub> <sup>(1)</sup> (x10 <sup>6</sup> ) (psi)	Axial		Joist/Beam			Plank			Equivalent Specific Gravity for Connections			Min. Shear Wall Nail Spacing <sup>(5)</sup> (in)

TimberStrand® LSL													
1.3	0.661	1,835	1,300	1,700 <sup>(6)</sup>	425	710	1,900	150	670	0.50	0.42	0.42 <sup>(7)</sup>	6 <sup>(7)</sup>
1.5	0.762	2,105	1,815	2,250 <sup>(6)</sup>	505	860	2,525	150	750			0.42	2
1.55	0.788	2,170	1,290 <sup>(8)</sup>	2,325 <sup>(6)</sup>	310 <sup>(8)</sup>	900	2,615	150	775			0.42	2
Parallam® PSL													
1.8	0.915	2,500	1,995	2,500 <sup>(9)</sup>	230	545	2,400 <sup>(9)</sup>	190	545	0.50	0.50	N.A.	N.A.
2.0	1.017	2,900 <sup>(10)</sup>	2,300	2,900 <sup>(9)</sup>	290	625	2,650 <sup>(9)</sup>	210	635				

(1) Reference modulus of elasticity for beam and column stability calculations per NDS®.

(2) Referenced tension design values are based on a standard 4 foot length. For lengths longer than 4 foot, multiply F<sub>t</sub> by the following adjustment (where L is length in feet):

– TimberStrand® LSL: (4/L)<sup>0.083</sup> – Parallam® PSL: (4/L)<sup>0.056</sup>

(3) When structural members qualify as repetitive members in accordance with the applicable building code, a 4% increase is permitted for F<sub>b</sub> in addition to the increases permitted in Footnotes 6 and 9.

(4) F<sub>c,⊥</sub> may not be increased for duration of load.

(5) Design shear wall applications per AWC SDPWS. When using StrandGuard® TimberStrand® LSL sill plate, see the *Trus Joist® Treated Sill Plates, Columns, and Studs Technical Brief*, TJ-8100.

(6) For 12" depth. For depths < 3½", use the 3½" factor; for other depths, multiply by  $\left[\frac{12}{d}\right]^{0.092}$ .

(7) Do not use AWC SDPWS with nail spacings less than 6" on-center. (Studs at boundary locations, where two panels abut, are allowed two rows at 6" on-center.)

(8) Value accounts for large hole capabilities. See **Allowable Holes** on page 14.

(9) For 12" depth. For depths < 3½", use the 3½" factor; for other depths, multiply by  $\left[\frac{12}{d}\right]^{0.111}$ .

(10) For column and stud applications, use F<sub>c||</sub> of 500 psi. Alternatively, refer to ESR-1387, Table 1, footnote 13.

## Allowable Design Properties (100% Load Duration)

### 1½" TimberStrand® LSL Studs

Design Property	Beam Orientation		
	1.3E	1.5E	
	3½"	5½"	7¼"

## WE CAN HELP YOU BUILD SMARTER

You want to build solid and durable structures—we want to help. Weyerhaeuser provides high-quality building products and unparalleled technical and field assistance to support you and your project from start to finish.

**Floors and Roofs:** Start with the best framing components in the industry: our Trus Joist® TJI® joists; TimberStrand® LSL rim board; and TimberStrand® LSL, Microllam® LVL, and Parallam® PSL headers and beams. Pull them all together with our self-gapping and self-draining Weyerhaeuser Edge Gold™ floor panels and durable Weyerhaeuser roof sheathing.

**Walls:** Get the best value out of your framing package—use TimberStrand® LSL studs for tall walls, kitchens, and bathrooms, and our traditional, solid-sawn lumber everywhere else. Cut down installation time by using TimberStrand® LSL headers for doors and windows, and Weyerhaeuser wall sheathing with its handy two-way nail lines.

**Software Solutions:** Whether you are a design professional or lumber dealer, Weyerhaeuser offers an array of software packages to help you specify individual framing members, create cut lists, manage inventories—even help you design a complete structural frame. Contact your Weyerhaeuser representative to find out how to get the software you need.

**Technical Support:** Need technical help? Weyerhaeuser has one of the largest networks of engineers and sales representatives in the business. Call us for help, and a skilled member from our team of experts will answer your questions and work with you to develop solutions that meet all your structural framing needs.

### LIMITED LIFETIME PRODUCT WARRANTY

Weyerhaeuser provides a limited warranty for the expected life of the structure for all Trus Joist® branded products. Product information, installation instructions, and the full text of each product's limited warranty (including limitations and exclusions) are available on the Weyerhaeuser website, from your Weyerhaeuser representative, or by calling toll free: 888-453-8358.

Additionally, Weyerhaeuser offers limited warranties on a broad variety of its other products. To see complete details of all Weyerhaeuser product warranties, visit [weyerhaeuser.com/woodproducts/warranty](http://weyerhaeuser.com/woodproducts/warranty).
